

## **RED Team**

### **Fernando Quevedo:**

- We have a design company that uses VR
- We want to use our company's resources, expertise and technology to create the city of the future.
- Our logo needs to be red because we are team red. It should be representative of the job we do or have some relation with our name.
- Our company name should represent our job and who we are. Someone mentioned REDesign, which is perfect.
- At the hypothetical time in which this city is being designed, we live in a time in which VR is everything.
- Be aware that it is VR and not AR. So each human lives in a fantasy world. It is not the existing world that is enhanced.
- Everything will be done via VR. Each activity. People would not go outside to enjoy the outside. They will go outside to maybe have more space or experience the air or the weather.
- The streets will be like hallways where people walk through like sheep in a farm.
- Activities done through VR will be
  - Education, taking classes, learning
  - Leisure activities (fun, dating, sexual life, music)
  - Working
  - Manufacturing

### **Henry Aguilar:**

- VR city for virtual learning. Instead of watching videos; we can experience someone knowledgeable perform their task to become familiar with their knowledge. (concept similar to AART)
- Literally a video game role :/
- What if world? Business idea → simulate in VR → see impact and see if its a good idea
- Virtually join together to attend classes (such as Google code bootcamp)

### **Anais Baca:**

- Design a city + name
- Include all aspects - city hall, vet clinics, shopping malls, etc.
- Explain examples of how we can incorporate VR into everyday life, whether it's grocery shopping, taking a pet to the vet, etc.
- Incorporate sustainability through eliminating things such as travel emissions, etc.
- Market on instagram, twitter to show progress of tema and capabilities within the virtual city

**Eduardo Garcia:**

- Group picture can be edited into the windows of a picture of a building to make the group picture more original
- Generate some instagram stories / instagram posts through canva
- One of the selling points is to connect people from all over the world with similar ideas

**Edgar Nuñez:**

- Our city should have different sections organized by categories such as entertainment, education, etc
- There should be a unique way to travel through the city, such as teleportation tracks and/or systems
- We should stay away from realistic/ realism and encourage/ focus on things that cannot exist in the “real world”
- We should use unity 3D to showcase some of our ideas

**Danny Guevara:**

- Attractions of a city - For example New York City
  - Parks
  - Restaurants
  - Buildings
  - Stores
  - Arenas
  - ponds/rivers
- Walk through of the cities to help better communicate the city
  - VR Headsets
  - Phones that helps walk through the city
- The city can be a place of opportunities
  - Schools/Universities
  - Social life
  - Industry Training
  - Medical Advice

**Yolanda Reyes:**

- City Planning:
  - A VR unemployment office with VR training. Newcomers to our city can take training and after be placed in a pool of qualified applicants who are looking for employment. The city can fill positions and make accessible to city partners this database for outside opportunities. City partners with VR work training can join a

database of available training simulations and potentially be placed in these outside companies.

- A VR simulation for drug use was proposed by one member and I think that would be one interesting way to allow current providers of an illegal substance, a legal avenue to business ownership and tax paying. It would also reduce the impact on our health and free up public safety resources/manpower. If we consider drug use VR experience licensing in our city I feel we would also need to include similar provisions for sex workers.
- A VR city hall in our city with residents registered similarly to how Sweden uses their personal identity numbers for banks, insurance taxes. They would be able to participate in the civic process by submitting their personal identity numbers in order to submit public comments for instance.

**Daniela Quezada Nevárez**

- We are currently influenced by globalization and it is becoming easier to connect with different people, but there are still things to improve to have access to products, services and also to connect with people.
- We can have virtual reality to every aspect of life and to every activity we do day by day.
- Virtual reality can be very useful to make our life easier.
- VR for an specific aspect will be useful to have better access for an specific service or product. It will save time, money, and provide access for anyone without the need to leave your home; in addition, it will opportunity to do all around the world. For example, we can have a VR for education, job searching, to shop, social life, etc.
- The VR could be a platform where people join and pay for a service that they are looking for.
